Bright Coffee Shop Project Overview

Prepared by Alex Sibiya

Sales analysis period: January-June 2023

Project background

Bright Coffee Shop has appointed a new CEO who wants to grow revenue and improve product performance. This project examines historical sales to show which products generate the most revenue, when sales are strongest and how the three stores perform.

Purpose and objectives

The analysis supports decisions about stock availability and promotions. It compares product revenue and quantities sold, examines sales patterns by month and time classification, and identifies actions the business can test.

Data and tools

The supplied processed workbook contains 148,702 rows and 14 fields, covering Astoria, Hell's Kitchen and Lower Manhattan. Fields include sales date, product category and type, store location, revenue, units sold and time classification.

Tool Project role
Miro Project planning and data-flow mapping
Databricks and SQL Processing data and grouping sales results
Microsoft Excel Processed dataset, PivotTables and charts
Data Studio Additional dashboard visualisation
Microsoft PowerPoint Presentation of findings to the CEO

Business questions

Which product categories and types generate the most revenue? Which products sell the most units? How does revenue change over time? Which time classifications and stores contribute the most revenue?

Analysis process and findings

Project process

1. Understand the case study and define the business questions.
2. Plan the work using the flow chart and project schedule.
3. Inspect data fields, formatting and aggregation methods.
4. Process and group data in Databricks using SQL.
5. Analyse the exported results in Excel using PivotTables and charts.
6. Compare dashboard views and explain filter differences.
7. Present findings and proposed actions in PowerPoint.

Measures

The case study defines record revenue as unit price multiplied by transaction quantity. In the supplied processed workbook, total revenue is SUM(revenue), quantity is SUM(units_sold), and sales count is SUM(number_of_sales). Count of units_sold counts rows and should not replace the sum when measuring quantity.

Main results

Measure or finding Result
Total revenue 698,812.33
Total items sold 214,470
Sales count from processed measure 149,116
Highest-revenue category Coffee: 269,952.45 (38.6%)
Highest-revenue product type Barista Espresso: 91,406.20
Highest-volume product type Brewed Chai tea: 26,250 units
Strongest time classification Morning: 55.6% of revenue
Highest-revenue month June: 166,485.88
January-to-June revenue growth 103.8%
Coffee and tea together contribute 66.7% of revenue. Store revenue is closely balanced, with Hell's Kitchen contributing approximately 33.8%, Astoria 33.2% and Lower Manhattan 32.9%.

Recommendations and next steps

Recommended actions

Protect availability of popular drinks. Review stock levels and track stockouts during mornings, when total revenue is highest.
Test promotions during slower periods. Trial a drink-and-bakery offer and measure revenue per hour and profit margin before expanding it.
Review low-selling products. Check demand, shelf life and margins before reducing stock. Low revenue alone does not justify removing a product.
Improve reporting consistency. Automate daily reports by store, display active filters and use the same metric definitions across dashboards.

Project deliverables

The project materials include the case study, analysis planning overview, data-flow diagram, Gantt chart, processed Excel workbook, dashboard PDFs and a PowerPoint presentation. The assignment also requires SQL code,

Next steps

Confirm currency and metric definitions, retain exact times and transaction IDs in future exports, reconcile dashboard filters, and evaluate proposed promotions using stock availability and margin alongside sales.
